## 1. Asset-Based Approach

The asset-based approach calculates the value of a company by assessing its net asset value. This approach considers the company's tangible and intangible assets, deducts its liabilities, and arrives at the net worth of the business. It is particularly useful for companies with significant tangible assets, such as real estate or manufacturing industries.

## 2. Market-Based Approach

The market-based approach determines the value of a company by comparing it to similar businesses that are publicly traded. This method utilizes multiples, such as price-to-earnings ratio and price-to-sales ratio, to estimate the value of the company. It relies on the assumption that similar businesses in the market have similar valuations.

## 3. Income-Based Approach

The income-based approach estimates the value of a company by analyzing its future cash flows and discounting them back to the present value. This method takes into account the projected revenue, expenses, and profitability of the

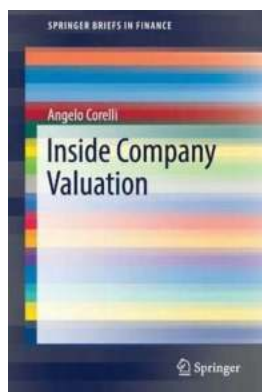

business. By discounting the future cash flows, it factors in the time value of money and provides a present value of the company.
