This book deals with the global mining boom of 2004. The boom, like any economic event, had a demand side and a supply side. The demand side was all about the rapid industrialisation and urbanisation created by the economic reforms enacted by China's post-Mao leadership. Indeed, if the boom can be said to have had a single cause, then it was the decision of the Chinese government to sell-off its huge stock of government-owned housing. That action created very active housing markets in China's cities where there had been practically none before. A massive and sustained bout of high-rise apartment construction followed. When China's demand for minerals could no longer be supplied from its own mines, the country had to turn to the wider world. But when the Chinese came knocking, the miners in the wider world were caught unprepared. They were in a defensive, cost-cutting mode, not geared up for expansion. After all, business conditions had been so poor for so long that benchmark prices for most minerals and metals were at record lows. Which helps explain why the price rises over the next few years were so sharp and so large. The aim of this book is to make clear the origins of the mining boom of 2004, how it unfolded and its aftermath. It is the second in a four-part series which examines the progress of global industrial development and the impact of that development on the global mining industry.
